

Facts About Skin Tags University Of Utah Health

If your mole seems to be different colors-- brownish, tan, black, and even red-- that's a very early indication it's turning into something else. None of these skin issues are dangerous to start with, but they can end up being unsafe if specific modifications begin to occur. Below are the early warning signs that your mole, bump, or growth is turning into something much more severe. If people start an over-the-counter treatment, they often second-guess themselves when the area starts to hurt. They understand they don't know what they're doing, and they can not stand the discomfort. So they stop the therapy too soon for it to be effective.

Moles occur when cells in the skin expand in a cluster rather than being spread throughout the skin. These cells are called melanocytes, and they make the pigment that offers skin its all-natural color. Moles may darken after direct exposure to the sun, throughout the teen years, and while pregnant. As the years pass, moles usually alter slowly, ending up being raised and/or changing shade.
