

Toilets are the most used plumbing fixture in any home, and they develop problems with corresponding frequency. Murrieta Valley Plumbing handles every type of toilet service for homeowners across Murrieta, Temecula, Menifee, and surrounding communities. A running toilet is the most common toilet problem and one of the most wasteful. A toilet that runs continuously can waste 200 gallons or more per day. The three most common causes are a failed flapper that does not seat properly, a fill valve that allows water to continuously refill the tank, or a float set too high that causes constant overflow into the overflow tube. All are straightforward repairs that Murrieta Valley Plumbing can diagnose and fix during a single visit. A toilet that rocks on its base is a sign of a failed or deteriorating wax ring. The wax ring seals the toilet base to the drain flange. When this seal fails, wastewater can leak onto the floor under the toilet, causing subfloor and structural damage if left unaddressed. Prompt repair prevents what is initially a minor seal failure from becoming a significant floor damage issue.

Slow-flushing toilets are usually caused by mineral buildup in the rim holes and jet under the toilet rim. Hard water [licensed Murrieta plumber](#) scale from Murrieta's water supply clogs these openings over time, reducing flush velocity. A thorough cleaning of these points typically restores flush performance. Complete toilet replacement is appropriate when a toilet is structurally compromised, excessively old and inefficient, or when a homeowner wants to upgrade to a water-saving model. California requires toilets in new construction and replacement to use 1.28 gallons per flush or less. Murrieta Valley Plumbing installs code-compliant, efficient toilets from leading manufacturers. For any toilet service in Murrieta, call +1 951-696-7100. Seven days a week. Free estimates.
